

Introducing NovoPath™ Paperless Document Management Module so that you never have to look for that paper record again!

NovoPath™, a leader in AP Software Solutions, announces the release of its new batch document Scanning solution for Paperless Document Management. With total efficiency in mind, the new module allows users to scan high volumes of consult reports, requisition slips, clinical lab reports, and insurance information and associate these documents automatically with the pathology case using automatic recognition of 1-D or 2-D barcode identification. This permanent association contributes to the patient safety, assuring accurate linkage of important information for instant and ready retrieval.

- No longer will transcriptionists need to sort through files of paper documents to locate requisition slips and consult reports when needed by the pathologist.
- Billers can now review the scanned insurance information, the billing codes, and the patient report all from the same location in NovoPath™.
- Medical records staff can easily view and retrieve outside consult reports directly from NovoPath™ for the specific patient.
- At accessioning, or at any time during the case process, a user can print bar-coded labels and attach them to the patient record and NovoPath™ will process them.
- NovoPath™ is compatible with widely available batch scanners. NovoPath™ reads the barcode information and inserts the document directly into the matching case, with no user intervention required.

The permanent association between the patient case and the scanned document contributes to the patient safety, assuring accurate linkage of important information for instant and ready retrieval.
