

Introducing NovoVoice™ voice dictation software system: Reduce Transcription Time, Improve Patient Safety, and Provide a “Virtual Transcriptionist” that can work remotely.

NovoVoice™ replaces outdated voice-dictation systems with an advanced digital wave file-based system that may be accessed from anywhere and at anytime. NovoVoice™ operates either as a standalone dictation system or integrated with most all Anatomic Pathology software Systems or Voice Recognition Engines, thus protecting your investment. In conjunction with NovoPath™ Anatomic Pathology software, NovoVoice™ will improve patient safety by associating and tracking all voice recordings on a case-by-case basis utilizing various tools to measure productivity.

- NovoVoice™ protects your investment by easily converting voice to text using any voice recognition engine, foot-pedals, microphones, and handheld devices to easily transcribe speech into reports.
- NovoVoice™ operates as a Standalone dictation and recognition system or as an integrated solution with NovoPath™ or other existing information systems.
- NovoVoice™ offers a comprehensive way to manage users for security and for listener/recorder preferences based on priorities and groups.
- NovoVoice™ improves transcription related workflow with detailed reports that monitor productivity and performance. For example, the Total Activity Report provides a complete log and summary of all recording and listening activities for a given time frame.

NovoVoice™ operates as a standalone dictation and recognition system or as an integrated solution.
